

Every method we have trained — final accuracy
111 configurations, CIFAR-10, ResNet-20 + BatchNorm, 30 epochs, no augmentation

Marker = batch. The unified batch (16 arms, plus markers) is the one internally paired set: same pinned weights, same data order, evaluated every epoch, so differences inside it are seed-paired. campaign / resbench / adaptive share a second pinned set and are mutually paired; the ablation batch used a third (its plain baseline is 0.56 pp lower), so its arms carry a batch offset of roughly that size. Bars / bands = +/- 1 sample SD over the seeds available (descriptive, not confidence intervals); arms with one seed have none.
