

Test accuracy against epoch — one representative run per idea
 CIFAR-10, ResNet-20 + BatchNorm, 30 epochs, seed-averaged; the eight leading curves come from one internally paired batch

Dashed lines mark the resolution changes (epochs 6 and 12); the dotted line marks where the blur switches off (epoch 21). The eight leading curves share pinned weights and data order, so their ordering is paired; the four grey-area ideas (fixed 16x16, fixed blur, the mixture, the adaptive schedule) come from other batches and carry a batch offset of up to ~0.6 pp.
