

Test accuracy against epoch — one representative run per idea
 CIFAR-10, ResNet-20 + BatchNorm, 30 epochs, seed-averaged; eight curves from the unified batch, four from other batches

Dashed lines mark the resolution changes (epochs 6 and 12); the dotted line marks where the blur switches off (epoch 21). campaign, resbench and unified (and Aubin's seed-0 runs) share the pinned asset set r20bn-campaign-assets; the ablation batch shares its data order but not its initial weights. Plain runs on identical assets still finish up to 0.73 pp apart across batches (cause not established), so cross-batch gaps of that size are not interpretable.
